Slide 1 — HCI

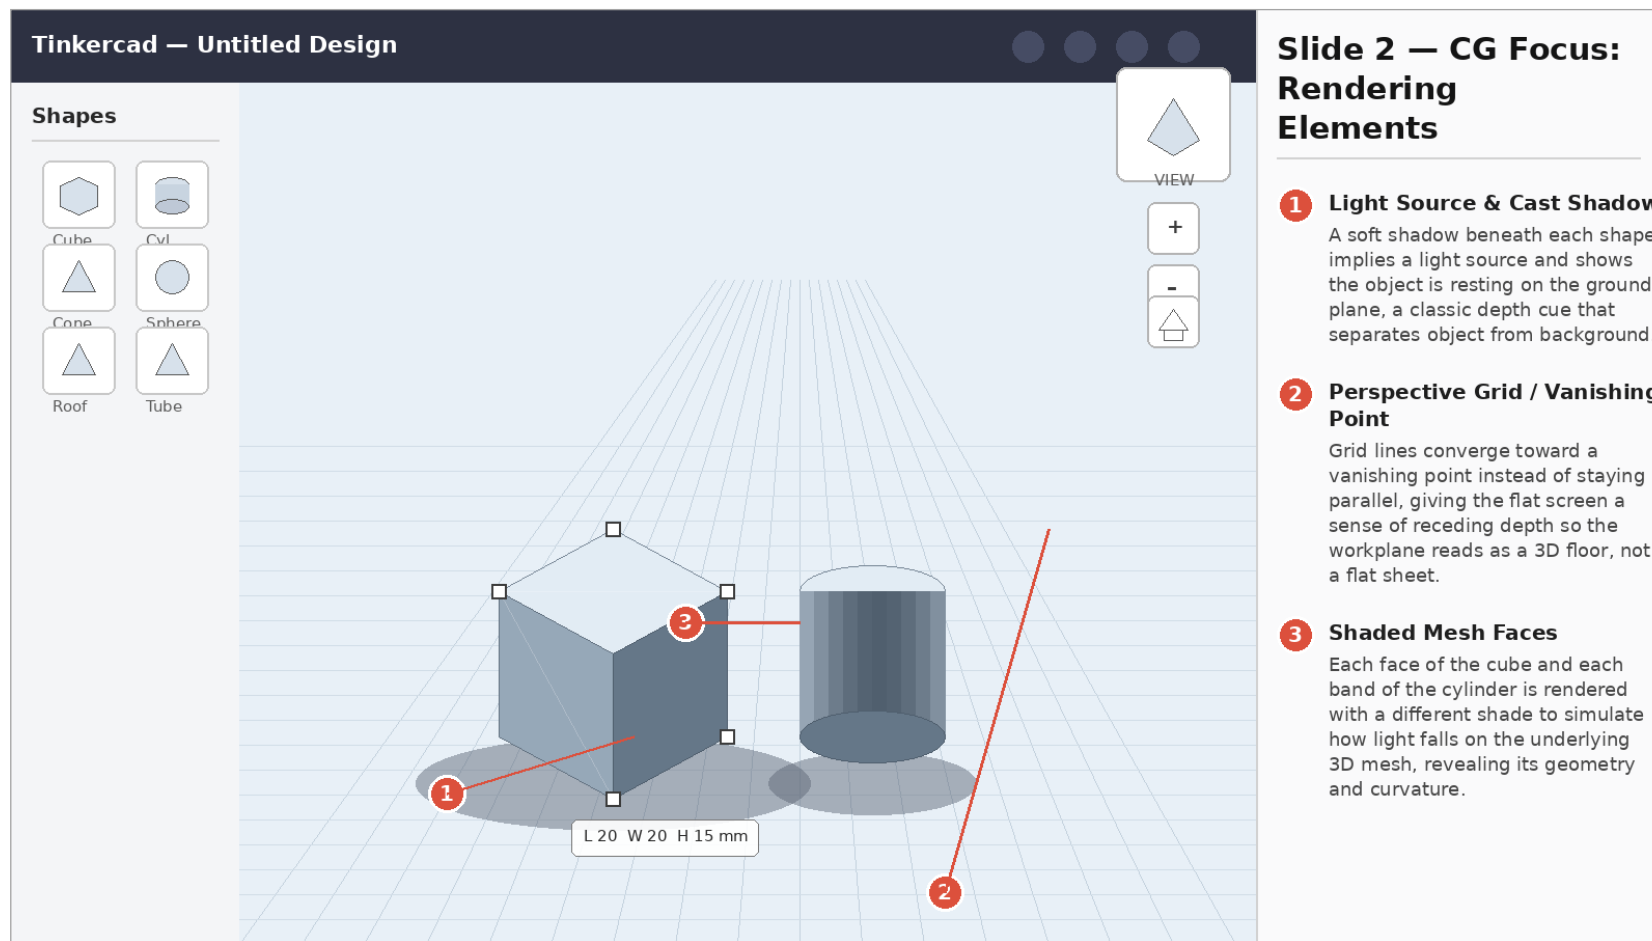

Focus: Interaction Elements

- Shapes Menu Panel**

A labeled, always-visible panel of draggable shape icons. The clear icons and drag affordance let a new user start building without reading instructions.
- View / Navigation Controls**

The view-cube, zoom +/- and home button give direct, one-click control over the camera. Immediate visual feedback (the model rotates as you drag) keeps the user oriented in 3D space.
- Dimension Handles**

Small draggable squares on the shape plus a live numeric readout (L/W/H) let the user resize by direct manipulation, confirming the change instantly instead of typing into a hidden menu.

Reflection

1. Does CG quality help or hinder interaction?

Tinkercad's simple shading and shadows make objects read as 3D instantly without slowing the app down, helping a beginner focus on modeling. Richer, more realistic lighting could hinder interaction by slowing rendering and making small features harder to click.

2. One simple HCI change?

I would add a brief on-screen hint next to the view-cube (e.g. "Drag to rotate, scroll to zoom") during a user's first session, since the navigation icons are clear but their exact gestures aren't obvious to first-time users.
